aintegumaenta-like protein - Arabidopsis thaliana
N.Alternate names: protein T12E18.10
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Jate: 20-Apr-2000 #sequence_revision 20-Apr-2000 #text_change 20-Apr-2000
C;Accession: T47591
R;Bloecker, H.; Mewes, H.W.; Lemcke, K.; Mayer, K.F.X.; Quetier, F.; Salanoubat M.Mewe submitted to the Protein Sequence Database, March 2000
A;Accession: T47591
A;Accession: T47591
A;Accession: T47591
A;Status: preliminary
A,Status: preliminary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PUNCTION: Probable transcriptional activator that promotes early floral meristem identity. Is required subsequently for the transition of an inflorescence meristem into a floral meristem. Plays a central role in the specification of floral identity, particulary for the normal development of sepals and petals in the wild-type flower. Acts as A class cadastral protein by repressing the C class floral homeotic gene AGAMOUS in association with others repressors like LEUNIG and SEUSS. It is also required
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  homeotic protein AGAMOUS in stamens and carpels.
MISCELLANBOUS: Mutations in the APETALA2 gene result in the actopic expression of AGAMOUS, leading to the replacement sepals by carpels and stamens and of petals by stamens.
SIMILARITY: Contains 2 AP2/ERF domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  shoot apex, and at enhanced levels in the inflorescence meristem, young floral buds, and throughout the early stages of flower development and organogenesis. During floral organ differentiation it becomes spatially restricted to specific organ, tissue, and cell types within the flower.

INDUCTION: Negatively regulated by the C class floral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TISSUE SPECIFICITY: Sepals, petals, stamens, carpels, developing ovules, inflorescence stem, leaf, and stem.

DEVELOPMENTAL STAGE: It is detectable at low levels throughout
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  during seed development.

Note=Produced by alternative splicing of isoform 2;
Note=Springing the production of isoform 2;
In stage 3 embryos, and in blastoderm cells, including pole cells.
Expressed throughout the rest of embryogenesis. Later, it is expressed at higher level in epidermal cells and CNS.
DEVELOPMENTAL STAGE: Isoform 3 is expressed both maternally and

Involved in neuronal cell fate, survival and axon guidance, cell cycle regulation and repression of head identity in the embryonic trunk. May act with the Hox gene Deformed and the EGF receptor signaling pathway. Positive regulator of the Wg pathway in larval tissues but not in embryonic tissues. May act as a transcriptional corepressor protein, which repress transcription via the recruitment of large complexes containing histone deacetylase
                                                                                                          zygotically.

SIMILARITY: Belongs to the Spen family.

SIMILARITY: Contains 3 RNA recognition motif (RRM) domains.

SIMILARITY: Contains 1 SPOC domain.

CAUTION: It is uncertain whether Met-1 or Met-7 is the initiator.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            expression in flowers.

DOMAIN: Contains two distinct DNA-binding domains. One is located in the N-terminal region and binds to the 5'-CAACA-3' motif. The second is located in the C-terminal region and binds to the 5'-CACCTG-3' motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBUNIT: Monomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ence 302:842-846(2003).

FUNCTION: Binds specifically to bipartite recognition sequences composed of two unrelated motifs, 5'-CAACA-3' and 5'-CACCIG-3'.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SIMILARITY: Contains 1 AP2/ERF domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SÜBCELLULAR LOCATION: Nuclear (Probable).
TISSUS SPRCIFICTY: Expressed in all tissues examined: Roots,
rosette leaves, cauline leaves, inflorescence stems, flowers ar
siliques. Highest expression in roots and rosette leaves. Very

RT Highly divergent lentiviral Tat proteins activate viral gene
RT "Highly divergent lentiviral Tat proteins
RT expression by a common mechanism.";
RM Mol. Cell. Biol. 19:4592-4599(1999).

CC (CDM9/cyclin T) complex, also called positive transcription
CC (CDM9/cyclin T) complex transcriptional activator, Tat. It is
CC (CDM9/cyclin associated with CDM9 to form -TEPB. Cyclin T] is the
CC (CDM9/cyclin associated with CDM9 (By similarity).
CC (COMPONITY: Belongs to the cyclin family. Cyclin C subfamily.

Biol. Evol. 20:1281-1289(2003).
-!- FUNCTION: Could be a global transcriptional regulator. Modifies gene expression by affecting chromatin. May be involved in brain development and facial morphogenesis.
-!- SUBUNT: Probably binds EZHS. Binds annexin V in a calcium and phosphatidylcholine/phosphatidylserine-dependent manner (By

-! DEVELOPMENTAL STAGE: Expressed throughout development with a peak during the mound stage of morphogenesis.
-!- SIMILARITY: Belongs to the Tyr family of protein kinases.
-!- SIMILARITY: Contains 1 sterile alpha motif (SAM) domain.
                                                                                              SEQUENCE

Binds also to the transactivation domain of the HIV-1 nuclear transcriptional activator, Tat. It is probably the cis-acting transactivation response element (TAR) RNA-binding cofactor for Tat. Also serves as an essential cofactor for HIV 2-Tat and similan immunodeficiency virus (African mandrill) Tat function.

1. SUBCUNIT: Associates with CDM9 to form P-TEFB. Cyclin T1 is the predominant cyclin associated with CDM9 (By similarity).

1. SUBCELIULAR LOCATION: Nuclear (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pan troglodytes (Chimpanzee).

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
